SUMMARIES

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 9.607; Variance 4.824; scale 1.991

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence has been validated by Multiple Complete Digest Mapping. Comparison of the experimentally derived map digest fragments with sequence-predicted fragments is given below. Small fragments below a variable cutoff (approximately 400-600bp) are not mapped and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragment groups are separated by dashed lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            l error in 10,000 bp.
Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN.1 file.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single stranded regions:

Address all correspondence to: Mark Adams The Institute for Genomic Research 9712 Medical Center Dr. Rockville, MD 20850, USA e-mail address: humgenetigr.org. The orientation of the sequence is from 576 end to T7 end. Genes were identified by a combination of five methods including: XGRAIL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genescan (Chris Burge, http://gnomic.stanford.Edu/-chris/GENSCANW.html)searches of the complete sequence against a peptide database, and the Human gene Index database at TIGR (http://www.tigr.org/tdb/hgi/hgi/html), Genes without pepetide homolgy having spliced E5T hits are termed 'Unknown gene product'. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE).

On Jul 24, 1998 this sequence version replaced gi:3241936.
Address all correspondence to: Mark Adams The Institute for Genomic Research 9712 Medical Center Dr., Rockville, MD 20850, USA e-mail address: humgen@tigr.org. The orientation of the sequence is from SP6 end to T7 end. Genes were identified by a combination of five methods including: xGRAIL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, Washington), Genscan (Chris Burge, Washington)
                                                                                                                                                                                                                                                                                                                                                                                                                            http://gnomic.stanford.Edu/-chris/GENSCANW.html)searches of the complete sequence against a peptide database, and the Human gene Index database at TIGR (http://www.tigr.org/tdb/hgi/hgl.html).
Genes without pepetide homolgy having spliced EST hits are termed 'Unknown gene product'. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              bjloftus@tigr.org

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (06-JAN-1999) Joint Genome Institute, Lawrence Livermore National Laboratory, 7000 East Ave., Livermore, CA 94551, USA on Jan 4, 1999 this sequence version replaced gi:2570224.

Map and sequence oriented from ptelomere to centromere. This accession is comprised of overlapping cosmids R29828 (bases 1 to 40,974) and F25496 (bases 23,336 to 60,966). R29828 is separated from cosmid F23586 (AC004475) to the left by a Sequence gap of approximately 14 kb, which is to be filled by sequencing a restriction fragment from cosmid R27336 (currently in progress). Cosmid R25496 is separated from cosmid R37336 (currently in progress). Cosmid R25496 is separated from cosmid R37363 to the right by an expected sequence gap of at least 10 kb. Additional chr 19 map and betweence information are available at:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Lamerdin, J.E., McCready, P.M., Skowronski, E., Viswanathan, V., Burkhart-Schultz, K., Gordon, L., Dias, J., Ramirez, M., Stilwagen, S., Phan, H., Velasco, N., Do, L., Regala, W., Terry, A., Garnes, J., Danganan, L., Erler, A., Christensen, M., Georgescu, A., Avila, J., Liu, S., Attix, C., Andreise, T., Trankheim, M., Amico-Keller, G., Coefield, J., Duarte, S., Lucas, S., Bruce, R., Thomas, P., Quan, G., Krommiller, B., Arellano, A., Sanders, C., Ow, D., Nolan, M., Trong, S., Kobayashi, A., Olsen, A.S. and Carrano, A.V. The proteins can be used as antiqens or as compositions in the preparation of antibodies against the proteins. The polynucleotides can be used as probes for gene diagnosis, and as gene sources for gene therapy and large-scale production of proteins encoded by the cDNA. The host cells are used for the detection of ligands corresponding to the expressed proteins, and the screening of low mol.wt. medicines. Sequence 439 BP; 89 A; 137 C; 109 G; 104 T;
                                                                                                                                                                                                                                                        samples Claim 3: Page 14; 23pp; English.
Consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also 051735-45 and 051747-59.

15 Introducing random point mutations into nucleic acods -

17 Introducing random point mutations into nucleic acods -

18 WPI: 88-279927/40.

19 by prepn of single stranded template, annealing a primer, elongation by prepn of single stranded template of molecules and screening.

10 Introducing random point mutations were introduced into the alpha fragment of Random point mutations were introduced into the alpha fragment of E. coli beta-galactosidase. The wild type sequence was obtained as E. coli beta-galactosidase. The wild type sequence was obtained as E. coli beta-galactosidase. The wild type sequence was obtained as Single stranded template and an oligonucleotide was bybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The

The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host vector system. The sequence covers all 175 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         05-MAY-1988;

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also 051735-45 and 051747-59.

TSAR; totally synthetic affinity reagent; synthetic; binding de effector domain; concatenated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Q51746

Identifying proteins or peptide(s) which bind a ligand - by
PT screening a recombinant vector library expressing fusion proteins
promprising a binding domain and an effector domain
PS Disclosure; Page 35; 255pp; English.

CC 070470 is a generic DNA sequence used to generate random TSAR (Totally
CC Synthetic Affinity Reagents) peptides. This generic formula can also be
CC represented as follows: X(NNB)4(CAC)(NNB)4(CAC)(NNB)82(NNB)5(CAC)(NNB)8

C -(CAC)2(NNB)x. x and y are flanking restriction sites (X is not the same
CC as Y) that are not specified further. The peptides generated by this and
CC other generic sequences (070471-73) have invariant histidine residues
C1 incorporated into variant sequences. TSARs are concatenated
CC tergions - a binding domain with affinity for a ligand and a second
CC regions - a binding domain with affinity for a ligand and a second
CC deffector peptide portion that is chemically or biologically active. They
CC may further comprise a linker peptide between the 2 domains. The TSARs
CC deliver a chemically or biologically active moiety, eg. metal ion,
CC radioisotope, peptide toxin or enzyme, to the specific target or on the
CC cell. They can also replace the function of macromolecules, eg.
CC complex methods of hybridoma formation or in vivo antibod.

CC 0770467 is a generic DNA sequence used to generate random TSAR (Totally CC Synthetic Affinity Respents) peptides. This generic formula can also be CC represented as follows: X(NNB)16(TGC)(NNB)12(NNB)15(TGC)(NNB)17. X CC and Y are flanking restriction sites (X is not the same as Y) that are CC and Y are flanking restriction sites (X is not the same as Y) that are CC controlled further. Other generic sequences are shown in 070466-68.

CC Other specific peptides generated by these generic sequences are shown in CC comprising at least two functional regions - a binding domain with call of the sequences are shown in the comprising at least two functional regions - a binding domain with call the sequences are shown in CC cohemically or biologically active. They may further comprise a linker cc peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned CC in or flanking, the unpredicted or variant residues. These residues CC confers some degree of conformational rigidity to the peptides. The TSARs CC compsns. comprising a TSAR binding domain can be used in vivo to CC deliver a chemically or biologically active molety, eg. metal ion, cc. compsns. comprising a TSAR binding domain can be used in vivo to CC monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. CC mentional can be detection in a screening process.

Identifying proteins or peptide(s) which bind a ligand by Identifying proteins or peptide(s) which bind a ligand by Identifying proteins or peptides in the proteins screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain pisclosure; Page 35; 255pp; English.

Q70468 is a generic DNA sequence used to generate random TSAR (Totally Q70468 is a generic DNA sequence used to generate formula can also be represented as follows: X(NNB)11(TGC)(NNB)63(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Other specific peptides generated by these generic sequences are shown in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Generic DNA sequence to generate a random TSAR petide library.                                                                                                                                                                                                             CC comprising at least two functional regions - a binding domain with CC affinity for a ligand and a second effector peptide portion that is CC chemically or biologically active. They may further comprise a linker CC peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned CC in, or flanking, the unpredicted or variant residues. These residues CC confer some degree of conformational rigidity to the peptides. The TSARs CC crompsns. comprising a TSAR binding domain can be used in vivo to CC deliver a chemically or biologically active molety, eg. metal ion, CC cradicisotope, peptide, toxin or enzyme, to the specific target or on the CC cell. They can also replace the function of macromolecules, eg. CC monocional or polyclonal antibodies and therefore circumvent the need CC complex methods of hybridoma formation or in vivo antibody CC groduction. The TSARs are easily characterised and have designed activity SQ Sequence 114 BP; 0 A; 2 C; 2 G; 2 T;

PT Identifying proteins or peptide(s) which bind a ligand - by PT Identifying proteins or peptide(s) which bind a ligand - by PT screening a recombinant vector library expressing fusion proteins pT comprising a binding domain and an effector domain PT Disclosure; Page 36; 255pp; English.

CC 070470 is a generic DNA sequence used to generate random TSAR (Totally CC officially Reagents) peptides. This generic formula can also be CC represented as follows: X(NNB)4(CAC)(NNB)4(CAC)(NNB)8(X(NNB)6(CAC)(NNB)8 (CAC)(NNB)8 (CAC) (NNB)8 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-AUG-1994; UO1-FEB-1994; UO1-FEB-1993; UO1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Generic DNA sequence to generate a random TSAR peptide library. TSAR; totally synthetic affinity reagent; synthetic; binding do effector domain; concatenated heterofunctional protein; linker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Q70470;

                                           In Identifying proteins or peptide(s) which bind a ligand - by PT Screening a recombinant vector library expressing fusion proteins processing a recombinant vector library expressing fusion proteins processing a binding domain and an effector domain processing a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins or peptides; page 33; 255pp; English.

CC 070468 is a generic DNA sequence used to generate random TSAR (Totally CC Synthetic Affinity Reagents) peptides this generic formula can also be CC represented as follows: X(NNB)11/TGC)(NNB)52(NB)1/TGC)(NB)10/Y. X (CC and year flanking restriction sites (X is not the same as Y) that are CC contributed further. Other generic sequences are shown in 070466-68.

CC affinity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with a finity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with heavy research peptide contains 2 or 4 cysteine residues positioned CC in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs comprising a TSAR binding domain can be used in vivo to CC deliver a chemically or biologically active moiety, eg. metal ion, call of the peptides of the TSARs are easily characterised and have designed activity sequence 114 Bp; 0 A; 2 C; 2 G; 2 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

PT Identifying proteins or peptide(s) which bind a ligand - by Identifying proteins are peptide(s) which bind a ligand - by Identifying proteins are peptides of the comprising a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins proteins proteins are comprising a binding domain and an effector domain proteins proteins proteins are shown in proteins of the same as proteins are shown in construction sites (X is not the same as Y) that are conditional regions - a binding that are conditional regions - a binding that are comprising at least two functional regions - a binding domain with comprising at least two functional regions - a binding domain with comprising at least two functional regions - a binding domain with comprising at least two functional regions - a binding domain with comprising at least two functional regions - a binding or peptides. Comprising at least two functional regions - a binding or peptides. Comprising at least two functional regions - a binding or peptides. Comprising at least two functional regions - a binding or peptides. Comprising at least two functional regions - a binding or peptides or that is comprised peptide contains 2 or 4 cysteine residues positioned conformational regions are also designed so conformational rigidity to the peptides. The TSARS correspondence are comprised, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. metal ion, or flanking, the unpredicted or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. metal conformational rigidity to the specific target or on the cell. They can also replace the function of macromolecules, eg. conformational repolace and therefore circumvent the need conformation of macromolecules and the conformation of recomplex metals and the conformation of the conformation o
                                                                                                                                  δõ
                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                8

PT identifying proteins or peptide(s) which bind a ligand - by PT identifying proteins or peptide(s) which bind a ligand - by PT screening a recombinant vector library expressing fusion proteins PT comprising a binding domain and an effector domain
PS Disclosure; Page 35; 25pp; English.
CC 970469 is a generic DNA sequence used to generate random TSAR peptide
CC 970469 is a generic DNA sequence used to generate random TSAR peptide
CC 970469 is a generic DNA sequence used as follows: XIGC)(NNB)10-CC
CT fils generic sequences (NNB)14/GCC)Y. X and Y are flanking restriction
CC sites (X is not the same as Y) that are not specified further. This
CC sequence generates peptides that are cloverleaf in Structure. Other
CC generated by these generic sequences are shown in R65150-54. TSARs are
CC concatenated heterofunctional proteins or peptides, comprising at least
CC a second effector peptide portion that is chemically or biologically
CC a second effector peptide portion that is chemically or biologically
CC active. They may further comprise a linker peptide between the 2 domains.
CC contains 2 or 4 cysteine residues positioned in, or flanking, the
CC contains 2 or 4 cysteine residues positioned in, or flanking, the
CC contains 2 or 4 cysteine residues positioned in, or flanking, the
CC contains 2 or 4 cysteine residues. These residues confer some degree of
CC contains 2 or to the specific target or on the cell. They can also replace
CC contains of macromolecules, eg. mencal ion, radioisotope, peptide, toxin
CC and therefore circumvent the need for complex methods of hybridoma
CC contains of macromolecules, eg. mencal contended in hybridoma
CC contains of a screening process.
                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                         몽

This generic formula can also be CC represented as follows: X(NNB)6(TCC) (NNB)11Z(NNB)14(TGC)(NNB)3Y: X CC and Y are flanking restriction sites (X is not the same as Y) that are consisted by these generic sequences are shown in 070466-68. CC other specified further. Other generic sequences are shown in 070466-68. CC other specified further encountenated betterofunctional proteins or peptides, finity for a ligand and a second effector peptide portion that is CC chemically or biologically active. They may further comprise a linker CC that the expressed peptide contains. The oligonucleotides are also designed so that the expressed peptide or variant residues. These residues or compsis. comprising a TSAR binding domain can be used in vivo to colliver a chemically or biologically active moiety eg. metal ion, cf. cliver a chemically or biologically active moiety. eg. metal ion, cell-ver a chemically or biologically active moiety. eg. metal ion, cell-ver a chemically or biologically active moiety. eg. metal ion, cell-ver a chemically or biologically active moiety. eg. metal ion, cell-ver a chemically or biologically active moiety. eg. metal ion, cell-ver a chemically or biologically active moiety. eg. metal ion, cell-ver a chemically or biologically active moiety eg. metal ion, cell-ver a chemically or biologically active moiety eg. metal ion, cell-ver a chemically or biologically active moiety active to the peptide control or polyclonal antibodies and therefore circumvent the need cell-ver moiety allowing direct and rapid detection in a screening process. PS claim 5; Page 38; 71pp; English.
CC A method for treating airway disease in a subject has been produced,
CC which involves the topical administration of an essentially adenosine
CC free antisense oligonucleotide (ON) to the airway epithelium of the
CC subject. The present sequence is an antisense oligonucleotide specific
CC for the human endothelin-1, targeted at the initiation codon. The
CC method can be used to treat airway disease such as cystic fibrosis,
CC asthma, chronic obstructive pulnoary disease, bronchitis and other
CC airway disease characterised by an inflammatory response. By
CC eliminating adenosine from the antisense ON, its liberation upon
CC antisense degradation is prevented, thereby preventing adenosine-
CC induced bronchoconstriction in patients with hyper-reactive airways.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C2p library is a subtracted library derived from the UI-R-C1 library, which is a subtracted library derived from the UI-R-C0 library. The UI-R-C0 library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-C2p) was constructed as follows: PCR amplified cORN inserts from UI-R-C1 clones from which 3 ESTs had been derived was used as a driver in a hybridization with the UI-R-C1 library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10b bacteria (Life Technologies) to generate the UI-R-C2p library. AN 1998-437479 [37] WPIDS

AB WO 9833926 A UPAB: 19980916

A method for detecting target LU105 nucleic acid (I) comprises treating a sample with at least one LU105-specific nucleic acid (II), or its complement. (II) is at least 50% identical with 190, 244, 225, 114, 562 or 519 bp sequences given in the specification, or their fragments and complements.

Also claimed are:

- (1) (I) or its fragments able to hybridise selectively to the LU105 gene and having at least 50% identity with the 190, 244, 225, 114, 562 or 519 bp sequences given above;
- (2) recombinant expression systems including (I) and control sequence;
 - (3) cells transformed with this expression system;
- (4) LU105 polypeptides (III) at least 50% identical with the 104, 26, 19, 21, 18 or 19 amino acid (aa) sequences given in the specification or their fragments;
- (5) antibodies (Ab) that bind to at least one LU105 epitope present in (III);
- (6) cells transformed with the 190, 244, 225, 114, 562 or 519 bp sequences described above;
 - (7) LU105 specific nucleic acid (II); and
- (8) genes, or their fragments, that encode a protein at least 50% identical with the 104 aa sequences as in (4).

USE - LU105 is a lung disease marker. Cells as in (3) are used to express recombinant (III) which are used to raise Ab. Ab are used to detect the LU105 antigen, and correspondingly this antigen is used to detect specific antibodies, in usual immunoassays. (I) and (III) are used for diagnosis, staging, monitoring, prognosis, prevention, treatment (e.g. using antisense molecules, ribozymes, Ab or other antagonists) and determination of susceptibility to, lung disease

, specifically cancer. (III) are also used to screen for specific binding agents, potentially useful therapeutically. LU105 is a marker for lung disease (present at high

concentration, in altered form or in an unusual body compartment).

ADVANTAGE - LU105 can be detected in blood, plasma or serum in an inexpensive, non-invasive test.

Pigeon intestinal mucin, a complex high mol. wt. glycoprotein, is a key antigen in the development of pigeon fanciers' lung (PFL). We have studied the specificity of antibodies to mucin in patients with PFL and asymptomatic antibody-pos. individuals. Extensive papain digestion, which removes the non-glycosylated regions of the mucin leaving the heavily glycosylated "bottle brush" regions, resulted in a 600-fold decrease in IgG3 antibody titers with little effect on IgG1 and IgG2 titers. This suggests that IgG1 and IgG2 are directed against the region rich in O-linked sugar chains while the majority of the IgG3 is directed against epitopes which are proteinase-sensitive. Lectin mapping of the carbohydrates present on pigeon intestinal mucin demonstrated high levels of exposed N-acetyl neuraminic acid, N-acetyl galactosamine and N-acetyl glucosamine, with lower levels of fucose and some galactose. from pigeon fanciers inhibited binding of lectins specific for N-acetyl neuraminic acid, N-acetyl galactosamine, internal N-acetyl glucosamine and fucose. Sera from people with PFL, compared with sera from asymptomatic antibody-pos. fanciers, had significantly higher titers of antibody that inhibited binding of four lectins specific for N-acetyl galactosamine and one fucose-specific lectin, suggesting that these sugars may play a dominant role in disease-assocd. epitopes. The results suggest that different IgG subclasses recognize different epitopes on mucin and that the epitopes recognized by the major subclasses are present on the O-linked oligosaccharides. Further, the carbohydrate-specific anti-mucin antibodies produced by PFL Shears 308-4994 Searcher :

Monoclonal antibody QCRL-1 is highly specific for a defined linear epitope in a relatively poorly conserved region of the human multidrug resistance protein (MRP). The authors have used QCRL-1 to examine MRP expression in archival and fresh snap-frozen samples of untreated small cell (SC) and non-small cell (NSC) lung cancers (LCs), as well as normal lung. The authors found that the majority (87%) of all histol. subtypes of NSCLC had detectable levels of MRP in most of the tumor mass. In a substantial proportion of adenocarcinomas (55%) and squamous cell carcinomas (28%), immunoreactivity approached that obtained with the highly multidrug resistant cell line H69AR from which the MRP was originally cloned. Both the level and frequency of MRP expression in untreated SCLC was significantly lower than in NSCLC. The MRP was detectable in only 56% of SCLC tumors and, in most cases, was expressed in small focal clusters of cells. Immunofluorescence studies of tumor tissue and normal lung confirmed the plasma membrane location of the MRP. However, in normal bronchial epithelium and seromucous glands, unlike in tumor cells, the MRP was detected only on basolateral membranes. In addn., strong MRP immunoreactivity was detected in reactive type II pneumocytes present in hyperplastic alveoli, but not in normal type I and type II pneumocytes. No potentially confounding correlation independent of its possible role in drug resistance was obsd. between MRP expression in untreated NSCLC and any clinicopathol. parameter examd., including overall survival.

AB Novel cell cycle regulatory polynucleotide transcripts and their encoded polypeptides are provided which were identified as the products of alternatively spliced mRNA for cyclin/CDK inhibitors, p16INK4A and p15INK4B, and a 5' nucleotide sequence referred to as 5'ALT. The p16 and p15 genes colocalize to human chromosome 9p21, which has been identified as a region having homozygous deletions in many tumors. 5'ALT also resides on chromosome 9p21, just 5' of exon 2 of p15, and about 30 kb upstream from p16. Polynucleotide transcripts are provided in which a 5'ALT polynucleotide is operatively linked to (1) exon 2 and exon 3 of p15 or (2) exon 2 of Searcher: Shears 308-4994

p15. These transcripts are assocd. with normal growth control and regulation of cellular proliferation and provide a means for the development of more accurate diagnostic, prognostic, and therapeutic regimes for disorders assocd. with control of cell cycle progression and cell differentiation and the loss of such control. Methylation of p16 DNA and a resultant decrease in p16 gene expression is assocd. with transcriptional block and is assocd. with a variety of neoplasms. Thus, a method for detecting a neoplasm in a subject by detecting methylation of 5'CpG islands in p16 DNA, or detecting p16 mRNA or polypeptide levels in a sample is also provided. Preferably, the method utilizes a methylation-sensitive restriction endonuclease in order to detect p16 methylation. The 5'ALT, or 5'ALT-p16 or 5'ALT-p15 polypeptides can also be used to produce antibodies which are immunoreactive or bind to epitopes of the resp. polypeptides.

KL-6 classified as Cluster 9 (MUC-1) is a circulating high-mol.-wt. mucin-like mol. Serum level of KL-6 was measured by a sandwich assay using KL-6 antibody as not only a catcher but also as a tracer. The authors established 2 addnl. monoclonal antibodies (MAbs), LISA 101 and EH-123, reacting with KL-6 epitopes different from the epitope recognized by KL-6 antibody. The KL-6-assocd. mucins detected by the sandwich assay using LISA 101 or EH-123 antibody as a catcher and KL-6 antibody as a tracer were designated as LISA 1-6 and CAM 123-6 resp. The diagnostic values as the serum markers of KL-6, LISA 1-6 and CAM 123-6 were evaluated measuring their levels in the same serum from healthy individuals and from patients with pulmonary, pancreatic and breast adenocarcinomas. KL-6 was increased abnormally at high rates of more than 50% in pancreatic cancer and in benign lung diseases, LISA 1-6 only in pancreatic cancer, and CAM 123-6 only in pulmonary adenocarcinoma. In benign lung diseases, however, LISA 1-6 and CAM Searcher Shears

			?
			•3
		3	
•			

123-6 were increased abnormally at the rates of only 5.3% and 0% resp. These observations clearly indicate that LISA 1-6 and CAM 123-6 constitute a part of KL-6, but that they are superior to KL-6 as tumor markers for pancreatic cancer and for pulmonary adenocarcinoma resp., because of their much lower false-pos. rates.

Hypersensitivity pneumonitis resulting from environmental exposure to Saccharopolyspora rectivirgula (Micropolyspora faeni) among farmers has been well recognized. The diagnosis of the disease depends on demonstration of circulating antibodies against S. rectivirgula. However, dependable pure antigens are not available for serodiagnosis. The authors employed hybridoma technol. to obtain monoclonal antibodies against S. rectivirgula antigens. These monoclonal antibodies were employed to purify antigens through affinity chromatog. When tested in ELISA, high levels of antibodies were demonstrated against these antigens in farmer's lung patient sera compared to exposed but asymptomatic individuals from the same household. In Western blots, patient sera reacted with components of crude antigens with mol. masses of 28, 35, 60, 65 and 68 kD and 4 components above 100 kD, while the monoclonal antibodies reacted only with the 60-kD protein. These purified antigens can be used as reliable reagents in the specific diagnosis of farmer's lung diseases.

Automated assays for the measurement of crosslinked fibrin derivs. in plasma (XL-FbDP) were developed by using latex beads coated with anti-D-dimer monoclonal antibody (DD-3B6/22) for both the Cobas Fara Chem. Centrifugal and the Cobas Mira analyzers (Roche, Basle, Switzerland). The analyzers were programmed to mix plasma and latex reagent simultaneously and analyze absorbance changes over a 10-15 min period. Results were interpolated by the analyzer from a std. curve derived from a polymer of D-dimer. Both assays had high precision (<5% CV) for values between 100 and 1000 ng/mL and provided clear discrimination between normal samples and samples from patients suffering from the thrombotic diseases deep vein thrombosis/pulmonary embolism and disseminated intravascular coagulation. The results obtained for XL-FbDP detn. with both methods compared well with established methods: a high correlation was obtained with a semiquant. manual latex method for both the Fara (r = 0.92) and Mira (r = 0.83) and correlations (r) of 0.81 (Fara) and 0.84 (Mira) were obtained with an EIA. Correlation between the 2 automated procedures was high (r = 0.96). The automated method will enable labs. to provide a rapid and accurate quantitation of Searcher Shears 308-4994 :

AB Persons at risk for a thrombotic event are identified by early immunol. detn. of elevated platelet surface TSP using a (labeled) monoclonal antibody to TSP. Thus, IgG-coated magnetic beads were exposed to an anti-TSP monoclonal antibody and then mixed with paraformaldehyde-fixed human platelets. After magnetic sepn. of the beads, the no. of platelets remaining in suspension was inversely related to TSP surface expression on the platelets. Diagnostic kits contg. reagents for the assay are described.

CODEN: PEREBL; ISSN: 0031-3998

DOCUMENT TYPE: Journal LANGUAGE: English

AB A major blood group antigenic epitope was identified on human pulmonary surfactant protein A (SP-A). Monoclonal (MAb) and polyclonal antibodies generated against purified human SP-A aggregated blood group A human erythrocytes and immunostained epithelial cells in a variety of human tissues, consistent with the tissue distribution of major blood group antigens. SP-A MAb (MAb-8) agglutinated red cells and immunostained tissues from A or AB blood groups, but did not react with cells or tissues from O or B individuals. MAb-8 immunostaining of tissue from blood group A individuals was ablated by incubation with blood group A red cells. MAb and polyclonal antibodies directed against A blood group antigens reacted strongly with purified SP-A obtained from a blood group A individual with alveolar proteinosis. MAb and polyclonal antibodies specific for B blood group antigen failed to react with SP-A from this patient or from patients who were in blood group B. Reactivity of anti-blood group MAb was lost after treatment of SP-A with endoglycosidase-F, demonstrating its reactivity with an epitope dependent on the asparagine-linked oligosaccharide at asparagine 187. Reactivity of MAb-8 with SP-A persisted after endoglycosidase-F treatment, but was lost after digestion with collagenase as assessed by Western blot after SDS-PAGE. Reactivity of MAb to SP-A was sensitive to .beta.-elimination, supporting the presence of another blood group antigenic site distinct from the epitope dependent on the asparagine-linked carbohydrate. The finding that the SP-A mol. contains a major blood group epitope has implication for the clin. use of surfactant replacement prepns. and diagnostic reagents based on this protein.

AB A series (12 clones) of hybridomas were obtained, which produce

	5.

monoclonal antibodies (Mab) to 5 different epitopes of the angiotensin-converting enzyme (ACE) mol. These antibodies may be used to (1) map antigenic structure of ACE, including the study of immunol. heterogeneity of ACE from different organs and tissues; (2) study the immunohistochem. distribution of ACE in human tissues, including the diagnosis of sarcoidosis; (3) develop an ACE immunoassay, and (4) prep. an immunosorbent for large-scale ACE isolation and for ACE-apheresis. One of the antibodies, 9B9, when injected into the circulation of rat and monkey, accumulated with high specificity in the lungs as compared with either normal mouse IgG or other organs and blood. The highly specific and nontoxic accumulation of Mab 9B9 suggests that it also may be used for .gamma. scintigraphy visualization of the pulmonary vascular bed, detection of lung injury, and as a vector for targeted drug delivery to the lung.

L₃

Evaluation of the immunol. contribution to the pathogenesis of isocyanate lung disease necessitates prepn. of isocyanate-protein conjugates to detect anti-isocyanate antibodies. Sera were obtained from 2 guinea pigs immunized with MDI and from 3 workers with occupational exposure to MDI. By use of Western blot anal., guinea pig IgG antibodies were best detected by the monomeric component of MDI-guinea pig serum albumin. ELISA addnl. indicated that conjugates which contained a high d. of hapten detected greater amts. of antibody than did conjugates contg. low amts. of hapten. The same procedures were then used to assess the amt. of MDI-specific IgG and IgE antibody in sera from symptomatic workers. Effective MDI-HSA antigens were those that were monomeric and had high haptenic content. Highly substituted conjugates of monoisocyanates (Ph isocyanate and p-tolyl isocyanate) with serum albumins were also effective in detecting antibodies to MDI. These results indicate the importance of the compn. of isocyanate conjugate antigens in detecting antibodies to diisocyanates and suggest that stds. be developed for prepn. and characterization of these diagnostic serol. reagents.

CODEN: CLCHAU

DOCUMENT TYPE: Journal LANGUAGE: English

Several modifications were made to the procedure of L. Gluck, et al. (1971) for evaluation of amniotic fluid lecithin/sphingomyelin (L/S) ratios. The acetone-pptn. step was eliminated, resulting in a faster extn. procedure and higher concns. of phospholipids. For faster thin-layer chromatog., silica gel-impregnated sheets of glass-fiber and a modified solvent system are used. For spot detection, a noncorrosive Bi subnitrate reagent specific for lecithin and sphingomyelin and an I vapor method to confirm the L/S ratio were used. The Bi spray also detected significant specimen contamination by phospholipids from plasma or erythrocytes. The L/S ratio was evaluated by visually comparing the relative size and color intensity of the lecithin and sphingomyelin TLC spots. An L/S ratio of 5 or more is consistent with mature pulmonary function and an L/S ratio of less than 2 suggests fetal pulmonary immaturity.

AB WO 993111,7 A UPAB: 19990908

NOVELTY - Isolated human nucleic acids (I) encoding secreted proteins, are new.

DETAILED DESCRIPTION - (I) comprises a polynucleotide (PN) having a nucleotide sequence (NS) at least 95% identical to:

- (a) a PN fragment of one of a total of 110 defined human cDNA sequences given in the specification or a PN fragment of the cDNA sequence included in ATCC Deposit No. Z which is hybridizable to one of the 110 defined cDNA sequences;
- (b) a PN which is an (allelic) variant of one of the 110 defined cDNA sequences;
- (c) a PN encoding a biologically active polypeptide or a polypeptide fragment, domain or epitope of one of the 110 Searcher : Shears 308-4994

					· .	
	Ş.:		. 2.			

defined amino acid sequences given in the specification or a polypeptide fragment, domain or epitope, respectively, encoded by a cDNA sequence included in ATCC Deposit No. Z which is hybridizable to one of the defined cDNA sequences;

- (d) a PN which encodes a species homolog of one of the 110 defined polypeptides; or
- (e) a PN capable of hybridizing under stringent conditions to any one of the PNs specified in (a)-(d), where the PN does not hybridize under stringent conditions to a sequence of only A residues or of only T residues.

ATCC Deposit No. Z refers to the representative clones, each containing a subset of the defined cDNA sequences, which have been deposited with the ATCC. The deposit numbers are ATCC 209463, 209511, 209551.

INDEPENDENT CLAIMS are also included for the following:

- (1) a recombinant vector comprising (I);
- (2) a method of making a recombinant host cell comprising (I);
- (3) a recombinant host cell produced by a method as in (2);
- (4) an isolated polypeptide comprising an amino acid sequence at least 95% identical to a polypeptide fragment (preferably having biological activity), domain, epitope, secreted form, full-length protein, (allelic) variant or species homologue of one of the 110 defined amino acid sequences or the encoded sequence included in ATCC Deposit No. Z;
- (5) an isolated antibody that binds specifically to an isolated polypeptide as in (4);
- (6) a recombinant host cell that expresses an isolated polypeptide as above;
- (7) a method of making an isolated polypeptide by culturing the host cell of (6);
 - (8) the polypeptide produced by the method of (7);
- (9) a gene corresponding to a cDNA sequence of the 110 defined amino acid sequences;
- (10) a method of diagnosing a pathological condition or a susceptibility to a pathological condition in a subject comprising:
- (a) determining the presence or absence of a mutation in (I); and
- (b) diagnosing a pathological condition or a susceptibility to a pathological condition based on the presence or absence of the mutation;
- (11) a method of diagnosing a pathological condition or a susceptibility to a pathological condition in a subject comprising:
- (a) determining the presence or amount of expression of the polypeptide of (4) in a biological sample; and
- (b) diagnosing a pathological condition or a susceptibility to a pathological condition based on the presence or amount of expression of the polypeptide;
- (12) a method for identifying a binding partner to the polypeptide of (4) comprising:

·		
- 2		
*		
	• • • • •	

- (a) contacting the polypeptide of (4) with a binding partner;
- (b) determining whether the binding partner effects an activity of the polypeptide; and
- (13) a method of identifying an activity in a biological assay, where the method comprises:
 - (a) expressing one of the 110 defined cDNAs in a cell;
 - (b) isolating the supernatant;
 - (c) detecting an activity in a biological assay; and
- (d) identifying the protein in the supernatant having the activity; and
 - (14) the product produced by the method of (13).

ACTIVITY - Cytostatic; Nootropic; Neuroprotective; Osteopathic; Antiseborreic; Dermatological; Antipsoritic; Antidiabetic; Antiasthmatic.

MECHANISM OF ACTION - None given.

USE - The PNs and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions (claimed), e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new PNs (claimed). Specific uses are described for each of the 110 PNs, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumors, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, reproductive disorders, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, Alzheimer's and cognitive disorders, schizophrenia, disorders involving osteoclasts such as osteoporosis, arthritis, sepsis, acne, asthma, psoriasis, stroke, trauma, diseases of testes, lung or prostate, digestive/endocrine disorders, diabetes and AIDS. The polypeptides are also useful for identifying their binding partners (claimed). Dwg.0/0

CR 1999-312869 [25]

AB WO 9922243 A UPAB: 19990707

NOVELTY - One hundred and forty eight isolated human genes and secreted proteins they encode are new.

DETAILED DESCRIPTION - An isolated nucleic acid molecule (NAM) (I) comprising a polynucleotide (PN) having a nucleotide sequence (NS) at least 95% identical to:

(a) a PN fragment of one of a total of 148 defined human cDNA sequences given in the specification or a PN fragment of the cDNA sequence included in ATCC Deposit No. Z which is

	s, je		
		1.2,	
*			

hybridisable to one of the 148 defined cDNA sequence;

- (b) a PN which is an (allelic) variant of one of the 148 defined cDNA sequences;
- (c) a PN encoding a biologically active polypeptide or a polypeptide fragment, domain or epitope of one of the 148 defined amino acid sequences given in the specification or a polypeptide fragment encoded by a cDNA sequence included in ATCC Deposit No. Z which is hybridisable to one of the defined cDNA sequences;
- (d) a PN which encodes a species homologue of one of the 148 defined polypeptides; or
- (e) a PN capable of **hybridising** under stringent conditions to any one of the PNs specified in (a)-(d), where the PN does not **hybridise** under stringent conditions to a sequence of only A residues or of only T residues.

INDEPENDENT CLAIMS are also included for:

- (1) a recombinant vector comprising (I);
- (2) a method of making a recombinant host cell comprising (I);
- (3) a recombinant host cell produced by a method as in (2);
- (4) an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence selected from a polypeptide fragment (preferably having biological activity), domain, epitope, secreted form, full-length protein, (allelic) variant or species homologue of one of the 148 defined amino acid sequences or the encoded sequence included in ATCC Deposit No. Z;
- (5) an isolated antibody that binds specifically to an isolated polypeptide as in (4); and
- (6) a recombinant host cell that expresses a gene corresponding to a cDNA sequence of the 148 defined amino acid sequences.

Note: From the disclosure 'ATCC Deposit No. Z' refers to the representative clones, each containing a subset of the defined cDNA sequences, which have been deposited with the ATCC. The deposit numbers are: ATCC 209299, 209346, 209300, 209324.an isolated polypeptide as above;

ACTIVITY - None given.

MECHANISM OF ACTION - None given.

USE - The PNs and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions (claimed), e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new PNs (claimed). Specific uses are described for each of the 148 PNs, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, ischemic shock, Alzheimer's and cognitive Searcher: Shears 308-4994

						4.	

disorders, schizophrenia, prostate diseases, obesity, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, **diseases** of testes, **lung** or thymus, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for **identifying** their binding partners (claimed).

AN 1999-153691 [13] WPIDS

WO 9906423 A UPAB: 19990331

An isolated nucleic acid molecule (NAM) (I) is claimed comprising a polynucleotide (PN) having a nucleotide sequence (NS) at least 95% identical to: (a) a PN fragment of one of a total of 83 defined human cDNA sequences given in the specification or a PN fragment of the cDNA sequence included in ATCC Deposit No. Z which is hybridisable to one of the 83 defined cDNA sequence; (b) a PN which is an (allelic) variant of one of the 83 defined cDNA sequences; (c) a PN encoding a biologically active polypeptide or a polypeptide fragment, domain or epitope of one of the 83 defined amino acid sequences given in the specification or a polypeptide fragment encoded by a cDNA sequence included in ATCC Deposit No. Z which is hybridisable to one of the defined cDNA sequences; (d) a PN which encodes a species homologue of one of the 83 defined polypeptides; or (e) a PN capable of hybridising under stringent conditions to any one of the PNs specified in (a)-(d), where the PN does not hybridise under stringent conditions to a sequence of only A residues or of only T residues. Also claimed are: (1) a recombinant vector comprising (I); (2) a method of making a recombinant host cell Shears 308-4994 Searcher

*	

comprising (I); (3) a recombinant host cell produced by a method as in (2); (4) an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence selected from a polypeptide fragment (preferably having biological activity), domain, epitope, secreted form, full-length protein, (allelic) variant or species homologue of one of the 83 defined amino acid sequences or the encoded sequence included in ATCC Deposit No. Z; (5) an isolated antibody that binds specifically to an isolated polypeptide as in (4); (6) a recombinant host cell that expresses an isolated polypeptide as above; and (7) a gene corresponding to a cDNA sequence of the 83 defined amino acid sequences. Note: From the disclosure ATCC Deposit No. Z refers to the representative clones, each containing a subset of the defined cDNA sequences, which have been deposited with the ATCC. The deposit numbers are: ATCC 209145, 209148, 209147.

USE- The PNs and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions (claimed), e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new PNs (claimed). Specific uses are described for each of the 83 PNs, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, restenosis, prostate diseases, obesity, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, diseases of lung or skin, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners (claimed). Dwg.0/0

Deposit No. Z; (5) an isolated antibody that binds specifically to an isolated polypeptide as in (4); (6) a recombinant host cell that expresses an isolated polypeptide as in (4); and (7) a gene corresponding to a cDNA sequence of the 87 defined amino acid sequences. Note: From the disclosure 'ATCC Deposit No. Z' refers to the representative clones, each containing a subset of the defined cDNA sequences, which have been deposited with the ATCC. The deposit numbers are: ATCC 97923, 97924, 97957, 97958, 209071, 209641, 209072 and 209073.

USE - The PNs and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions (claimed), e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new PNs (claimed). Specific uses are described for each of the 87 PNs, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukaemias, diseases of the immune system (including allergies or asthma), lymphocytic diseases, brain associated diseases, hepatic and renal disease, lymphomas, inflammation, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, restenosis, prostate diseases, obesity, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, diseases of testis, lung or thymus, digestive/endocrine disorders, including metabolic regulation, malabsorption, gastritis and neoplasms, and AIDS. The polypeptides are also useful for identifying their binding partners (claimed). Dwg.0/0

PRIORITY APPLN. INFO: US 1997-49183 19970611

AN 1999-060335 [05] WPIDS

AB WO 9856951 A UPAB: 19990210

Detection of a target LS170 polynucleotide (I) comprises treating a test sample with at least one LS170-specific nucleic acid (II) that has at least 50% identify with any of 9 sequences ((1)-(9), reproduced, of 251, 243, 258, 202, 458, 273, 200,1009 and 1027 bp, respectively), their fragments or complements. Also new are (a) LS170 sequences, or their fragments, that hybridise selectively to the LS170 gene and have at least 50% identity with (i) (1)-(9), other than (5) or their complements, or (ii) fragments of (1)-(7); (b) recombinant expression system containing (II) plus a control sequence; (c) cells transformed with this expression system; (d) LS170 polypeptides (III) at least 50% identical with 9 sequences ((23)-(31), of 256, 18, 26, 29, 12, 15, 11 or 19 amino acids (aa), reproduced), or their fragments, containing at least one LS170 epitope; (e) antibodies (Ab) specific for at least one LS170 epitope present on (III); (f) cells transformed with any of (1)-(9), their fragments or complements, encoding at least one epitope of LS170; (g) (I) having at least 50% identity with (i) any of (1)-(9), their fragments or complements or (ii) fragments of (1)-(7); (h) genes, or their fragments, encoding LS170 proteins at least 50% identical with (23); (j) genes, or their fragments, at least 50% identical with (8) or (9).

USE - LS170 represents a set of contiguous, partially overlapping sequences transcribed from lung tissue. They are used for diagnosis, staging, monitoring, in vivo imaging, prevention and treatment of lung disease, specifically cancer, and to indicate predisposition to such disease. Particularly detection of (I), LS170 antigens (using Ab in immunoassays) or anti-LS170 antibodies (using LS170 as antigen) is indicative of disease. Cells of (c) are used to express recombinant (III), used to raise Ab and for drug screening. LS170-related nucleic acid can be used to isolate related sequences; as standards and reagents in assays; as targets for drug screening, and as components or targets for therapy, e.g. as antisense, ribozyme or Searcher: Shears 308-4994

y 4 0		

triplex-forming agents. Ab can be used to deliver therapeutic agents to LS170-expressing cells; directly as therapeutic agents (by neutralising LS170 polypeptides); in competitive binding drug screens, and to generate anti-idiotypic antibodies for use in rational drug design.

AB

sequences.

9854963 A UPAB: 19990908 WO An isolated nucleic acid molecule (NAM) (I) comprising a polynucleotide (PN) having a nucleotide sequence (NS) at least 95% identical to: (a) a PN fragment of one of a total of 207 defined human cDNA sequences given in the specification or a PN fragment of the cDNA sequence included in ATCC Deposit No. Z which is hybridisable to one of the 207 defined cDNA sequence; (b) a PN which is an (allelic) variant of one of the 207 defined cDNA sequences; (c) a PN encoding a biologically active polypeptide or a polypeptide fragment, domain or epitope of one of the 207 defined amino acid sequences given in the specification or a polypeptide fragment encoded by a cDNA sequence included in ATCC Deposit No. Z which is hybridisable to one of the defined cDNA sequences; (d) a PN which encodes a species homologue of one of the 207 defined polypeptides; or (e) a PN capable of hybridising under stringent conditions to any one of the PNs specified in (a)-(d), where the PN does not hybridise under stringent conditions to a sequence of only A residues or of only T residues. Also claimed are: (1) a recombinant vector comprising (I); (2) a method of making a recombinant host cell comprising (I); (3) a recombinant host cell produced by a method as in (2); (4) an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence selected from a polypeptide fragment (preferably having biological activity), domain, epitope, secreted form, full-length protein, (allelic) variant or species homologue of one of the 207 defined amino acid sequences or the encoded sequence included in ATCC Deposit No. Z; (5) an isolated antibody that binds specifically to an isolated polypeptide as in (4); (6) a recombinant host cell that expresses an isolated polypeptide as above; and (7) a gene

Note: From the disclosure 'ATCC Deposit No. Z' refers to the representative clones, each containing a subset of the defined cDNA sequences, which have been deposited with the ATCC. The deposit numbers are: ATCC 97979, 97974, 97975, 97976, 97977, 209007, 209008, Searcher: Shears 308-4994

corresponding to a cDNA sequence of the 207 defined amino acid

209009, 209010, 209011, 209080, 209081, 209082, 209083, 209084, 209085, 209511,

USE The PNs and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions (claimed), e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new PNs (claimed). Specific uses are described for each of the 207 PNs, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, restenosis, prostate diseases, obesity, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, diseases of testes, lung or thymus, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners (claimed). Dwq.0/0

AB WO 9839446 A UPAB: 19990908

An isolated nucleic acid molecule (NAM) (I) comprising a polynucleotide (PN) having a nucleotide sequence (NS) at least 95% identical to:

(a) a PN fragment of one of a total of 70 defined human cDNA sequences given in the specification or a PN fragment of the cDNA sequence included in ATCC Deposit No. Z, which is

hybridisable to one of the 70 defined cDNA sequence;

- (b) a PN which is an (allelic) variant of one of the 70 defined cDNA sequences;
- (c) a PN encoding a biologically active polypeptide or a polypeptide fragment, domain or epitope of one of the 70 defined amino acid sequences given in the specification or a polypeptide fragment encoded by a cDNA sequence included in ATCC Deposit No. Z which is hybridisable to one of the defined cDNA sequence;
- (d) a PN which encodes a species homologue of one of the 70 defined polypeptides., or
- (e) a PN capable of hybridising under stringent conditions to any one of the PNs specified in (a)-(d), where the PN does not hybridise under stringent conditions to a sequence of only A residues or of only T residues.

Also claimed are:

- (1) a recombinant vector comprising (I),
- (2) a method of making a recombinant host cell comprising (1);
- (3) a recombinant host cell produced by a method as in (2):
- (4) an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence selected from a polypeptide fragment (preferably having biological activity), domain, epitope, secreted form, full-length protein, (allelic) variant or species homologue of one of the 70 defined amino acid sequences or the encoded sequence included in ATCC Deposit No. Z;
- (5) an isolated antibody that binds specifically to an isolated polypeptide as in (4);
- (6) a recombinant host cell that expresses an isolated polypeptide as in (4), and
- (7) a gene corresponding to a cDNA sequence of the 70 defined amino acid sequences.

Note., From the disclosure 'ATCC Deposit No. Z' refers to the representative clones, each containing a subset of the defined cDNA sequences, which have been deposited with the ATCC. The deposit numbers are- ATCC 97900, 97901, 97903, 97898, 209010, 97897, 97897, 97897, 97976, 97904, 97926, 209043-209050, 209085, 209084, 209236.

USE - The PNs and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions (claimed), e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new PNs (claimed). Specific uses are described for each of the 70 PNs, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukaemias, diseases of the immune system (including allergies or asthma), lymphocytic diseases, brain associated diseases, hepatic and renal disease, lymphomas,

inflammation, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, restenosis, prostate diseases, obesity, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, diseases of testis, lung or thymus, digestive/endocrine disorders, including metabolic regulation, malabsorption, gastritis and neoplasms, and AIDS. The polypeptides are also useful for identifying their binding partners (claimed).

WO 9845712 A UPAB: 19990210

An isolated nucleic acid molecule (NAM) (I) is claimed comprising a polynucleotide (PN) having a nucleotide sequence (NS) at least 95% identical to:(a) a PN fragment of a total of 20 defined human cDNA sequences given in the specification or a PN fragment of the cDNA sequence included in ATCC Deposit No. Z which is hybridisable to one of the 20 defined cDNA sequences; (b) a PN which is an (allelic) variant of one of the 20 defined cDNA sequence; (c) a PN encoding a biologically active polypeptide or a polypeptide fragment, domain or epitope of one of the 20 defined amino acid sequences given in the specification or a polypeptide fragment encoded by a cDNA sequence included in ATCC Deposit No. Z which is hybridisable to one of the defined cDNA sequences; (d) a PN which encodes a species homologue of one of the 20 defined polypeptides; or (e) a PN capable of hybridising under stringent conditions to any one of the PNs specified in (a) - (d), where the PN does not hybridise under stringent conditions to a sequence of only A residues or of only T residues. Also claimed are: (1) a recombinant vector comprising (I); (2) a method of making a recombinant host cell comprising (I); (3) a recombinant host cell produced by a method as in (2); (4) an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence selected from a polypeptide fragment (preferably having biological activity), domain, epitope, secreted form, full-length protein, (allelic) variant or species homologue of one of the 20 defined amino acid sequences or the encoded sequence included in ATCC Deposit No. Z; (5) an isolated antibody that binds specifically to an isolated polypeptide as in (4); (6) a recombinant host cell that expresses an isolated polypeptide as in (4); (7) a gene corresponding to a cDNA sequence of one of the 20 nucleotide sequences given in the specification. Note: From the disclosure ''ATCC deposit No. Z'' refers to ATCC No's 97955 and 209074.

USE - The PNs and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions (claimed), e.g. by protein of gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new PNs (claimed). Specific uses are described for each of the 20 PNs, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of central nervous system (CNS) and immune system diseases, reproductive disorders, cancers,

		<i>I</i> = 0

congenital malformations, degenerative diseases, trauma, inflammatory disease, neoplasia, metabolic disorders, diseases in testes, placenta, liver, brain and activated T cells, spleen diseases, lung diseases, heart

diseases, rhabdomyosarcoma and disorders of the endocrine system or other endocrinopathies, e.g. endocrine polyglandular syndrome, endocrinoma, and endocrine ophthalmopathy, osteoclastoma and other bone remodelling disorders, bacterial infections and sepsis. The polypeptides are also useful for identifying their binding partners (claimed).

AB WO 9839448 A UPAB: 19990908

An isolated nucleic acid molecule (I) comprises a polynucleotide (PN) having a nucleotide sequence at least 95% identical to: (a) a PN fragment of one of a total of 186 defined human cDNA sequences given in the specification or a PN fragment of the cDNA sequence included in ATCC Deposit No: Z, which is hybridisable to one of the 186 defined cDNA sequences; (b) a PN which is an (allelic) variant of one of the 186 defined cDNA sequences; (c) a PN encoding a biologically active polypeptide or a polypeptide fragment, domain or epitope of one of the 186 defined amino acid sequences given in the specification or a polypeptide fragment encoded by a cDNA sequence included in ATCC Deposit No. Z, which is hybridisable to one of the defined cDNA sequences; (d) a PN which encodes a species homologue of one of the 186 defined polypeptides; or (e) a PN capable of hybridising under stringent conditions to any one of the PNs specified in (a)-(d), where the PN does not hybridise under stringent conditions to a sequence of only A residues or of only T residues.

Also claimed is an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence selected from:

(a) a polypeptide fragment (preferably having biological activity), domain, epitope, secreted form, full-length protein,

(allelic) variant or species homologue of one of the 186 defined

Searcher: Shears 308-4994

•	

amino acid sequences or the encoded sequence included in ATCC Deposit No: Z.

Note: From the disclosure ''ATCC Deposit No: Z'' refers to the representative clones, each containing a subset of the defined cDNA sequences, which have been deposited with the American Type Culture Collection. The deposit numbers are: ATCC 97897-97904 and ATCC 209076, 209215, 209139, 209011, 209119, 209235, 209627 and 209043-209050.

USE - The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions (claimed), e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides (claimed). Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of: cancer; tumours; neurodegenerative disorders; developmental abnormalities and foetal deficiencies; blood disorders; leukaemias; diseases of the immune system (including allergies or asthma); lymphocytic diseases; brain associated diseases; hepatic and renal disease; lymphomas; inflammation; ischaemic shock; Alzheimer's and cognitive disorders; schizophrenia; restenosis; prostate diseases; obesity; disorders involving osteoclasts such as osteoporosis, arthritis or malignancies; diseases of testis, lung or thymus; thyroiditis and thyroid tumours; digestive/endocrine disorders, including metabolic regulation, malabsorption, gastritis and neoplasms; and AIDS. The polypeptides are also useful for identifying their binding partners (claimed). Dwg.0/0

AN 1998-437479 [37] WPIDS

AB WO 9833926 A UPAB: 19980916

A method for detecting target LU105 nucleic acid (I) comprises treating a sample with at least one LU105-specific nucleic acid (II), or its complement. (II) is at least 50% identical with 190, 244, 225, 114, 562 or 519 bp sequences given in the specification, or their fragments and complements.

Also claimed are:

- (1) (I) or its fragments able to hybridise selectively to the LU105 gene and having at least 50% identity with the 190, 244, 225, 114, 562 or 519 bp sequences given above;
- (2) recombinant expression systems including (I) and control sequence;
 - (3) cells transformed with this expression system;
- (4) LU105 polypeptides (III) at least 50% identical with the 104, 26, 19, 21, 18 or 19 amino acid (aa) sequences given in the specification or their fragments;
- (5) antibodies (Ab) that bind to at least one LU105 epitope present in (III);
- (6) cells transformed with the 190, 244, 225, 114, 562 or 519 bp sequences described above;
 - (7) LU105 specific nucleic acid (II); and
- (8) genes, or their fragments, that encode a protein at least 50% identical with the 104 aa sequences as in (4).

USE - LU105 is a lung disease marker. Cells as in (3) are used to express recombinant (III) which are used to raise Ab. Ab are used to detect the LU105 antigen, and correspondingly this antigen is used to detect specific antibodies, in usual immunoassays. (I) and (III) are used for diagnosis, staging, monitoring, prognosis, prevention, treatment (e.g. using antisense molecules, ribozymes, Ab or other antagonists) and determination of susceptibility to, lung disease, specifically cancer. (III) are also used to screen for specific binding agents, potentially useful Searcher: Shears 308-4994

therapeutically. LU105 is a marker for lung disease (present at high concentration, in altered form or in an unusual body compartment).

ADVANTAGE - LU105 can be detected in blood, plasma or serum in an inexpensive, non-invasive test.

Isolated human chemokine beta -13 (CK beta -13) polypeptide Searcher : Shears 308-4994

			:. :
			G
a.			
•			
		- -	

comprises amino acid sequence: (a) 95 % identical or more to 93 amino acid sequence (I) given in the specification, (b) mature CK beta -13 polypeptide sequence comprising amino acids 25-93 or 29-93 of sequence (I); (c) encoded by cDNA clone contained in ATCC 97113; or (d) a sequence complementary to the sequences as in (a)-(b).

Also claimed are: (1) polypeptide comprising epitope -bearing portion of CK beta -13 protein comprising amino acids Thr22-Gly28, Asn30-Leu47, Thr56-Val65 or Phe70-Trp83 of sequence (I); (2) nucleic acid molecules as follows: (I) encoding CK beta -13 polypeptide sequences as above; (ii) complementary to (I); (iii) hybridising to (I) but not to polynucleotide with sequence consisting of only A or only T residues; (iv) encoding epitope-bearing portion of (I), optionally as in (1); (v) having 282 bp sequence (II) and optionally encoding CK beta -13 polypeptide sequences as above; (vi) at least 95 % identical to sequence encoding polypeptide with amino acids n-93, 1-m and n-m (n and m are integers between 1-35 and 77-93 respectively) of (I); and (vii) encoding polypeptide which is a portion of CK beta -13 sequence encoded by cDNA clone in ATCC 97113 excluding 1-35 amino acids from amino terminus and/or 1-17 amino acids from carboxy terminus; (3) recombinant vectors produced by inserting (I) into vector; (4) host cells produced by introducing the vector as in (4); and (5) antibody binding specifically to CK beta -13 polypeptide.

USE - The polypeptides and nucleic acids are useful in diagnosis and treatment of immune system-related disorders in mammals (preferably humans). Such disorders include tumours, cancers, interstitial lung disease and disregulation of immune cell function including leukaemias, lymphomas, autoimmune diseases etc. For example, certain tissues in mammals with cancer of the immune system express enhanced/decreased levels of CK beta -13 and mRNA encoding CK beta -13, and diagnosis can be achieved by assaying CK beta -13 gene expression and comparing to standard levels. The polypeptides can be administered therapeutically in pharmaceutical compositions e.g. to treat immune system-related disorders as above, treat sepsis, inhibit bone marrow stem cell colony formation during cancer therapy, regulate haematopoiesis, stimulate wound healing etc. Compositions comprising the polynucleotides may also be administered, especially to express CK beta -13 polypeptide in hosts to treat dysfunctions associated with aberrant endogenous CK beta -13 activity. The polynucleotides are also useful for mapping of chromosomes/chromosome sites. The polypeptides are useful to screen for agonists and antagonists of CK beta -13 activity. The antibodies are useful diagnostically or therapeutically e.g. as antagonists to treat subjects requiring CK beta -13 reduction. Dwg.0/4

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A novel cell cycle regulatory gene called 5'ALT is disclosed.

Methods for determining mutations or polymorphisms in 5'ALT or
5'ALT regulated genes in tissues are also provided. Novel
5'ALT-p16 and 5'ALT-p15 transcripts and truncated expression

products are also described.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A new method of determining oxidized .alpha.-1-proteinase inhibitor in serum or plasma for use in studying the development of chronic obstructive lung disease is disclosed. Levels of oxidized .alpha.-1-proteinase inhibitor indicate the potential for emphysema development with higher levels showing a decrease in

		:	• • • • • • • • • • • • • • • • • • • •
•	i,		

lung protection against elastolytic enzymes such as elastase. This method can be used for patients with a potential for chronic obstructive lung disease rather than having to use bronchial lavage methods for such patients. No other method is known to exist for determining oxidized .alpha.-1-proteinase inhibitor in serum or plasma.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
